DEEPBEAN RESEARCH / NOVEMBER 2026

Human purposes.
AI agency. Continuing worlds.

Huaiyang Liu · DeepBean Limited · wyonliu@gmail.com

Four connected papers on human purposes, self-authored AI agency, continuing worlds, and creation that grows through use.

The series connects four questions: how intelligence participates in forming purposes; how people shape their AI representatives; how consequences continue as worlds change; and how creative experience can improve subsequent production. Each paper has its own argument and evidence boundary.

---

01 / TAIHE

After AGI: We Need Humanism More Than Intelligence

A humanistic account of new purposes, participation, care, and revisable inheritance: what intelligence carries forward includes people's capacity to reshape a practice, alongside its outputs.

> Developed arguments and difficult cases, with finite computational diagnostics reported separately. The normative argument does not claim an empirically established algorithmic or human-benefit advantage.

---

02 / NUWA

Shaping AI Through Shared Life

A framework connecting self-authorship, situated representation, shared works, and subsequent action. People can change what the AI should represent rather than being reduced to a fixed inferred profile.

> Executable synthetic shared-creation samples and a real-model development study, with authored components and interface failures identified. Durable learning gains and long-term personal benefit remain unestablished.

---

03 / FUXI

Worlds Change, Consequences Continue

A runtime formulation binding earlier effects, current mechanisms, and accepted commitments, with recorded authorized revision. Reference implementations make continuation and its failure conditions inspectable.

> Finite models, HTTP execution records, and host-adaptation studies support the system formulation. Strong controls match key results; independent speed or learning superiority is not established.

---

04 / PANGU

Creating Worlds in Use

A production framework connecting editable worlds, revisable creative relations, current-work binding, and continued use. Its full remit spans reconstruction, geometry, materials, bodies, behavior, and presentation.

> Authored relation changes alter subsequent works. A real-model development batch records candidate update failure and one of two strong-agent works passing the task checks. Production-learning superiority and broad coverage remain unestablished.

Broader scope: personal and organizational intelligence, games and XR, physical–digital coexistence, and embodied systems. Domain transfer, long-term benefit, and recursive self-improvement require further evidence. Research discussions and collaboration are welcome.
